Kohn and Sham Equations

Kohn and Sham (1965)

$$\left[-\frac{\hbar^2}{2m_{el}} \nabla_r^2 + V_{eff}(r, n(r)) \right] \phi_i(r) = \varepsilon_i \phi_i(r)$$

$$V_{eff}(r, n(r)) = V(r)$$

External potential.

$$+ e^2 \int \frac{n(r')}{|r-r'|} dr'$$

Coulomb interaction.

$$+ \frac{\delta E_{xc}(n(r))}{\delta n(r)}$$

Exchange-correlation.

Can be generalized to include magnetism:

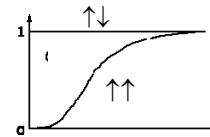

$$n = n_\uparrow + n_\downarrow$$

DFT lectures, 08/08+08/09/2009, UNM

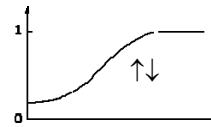

5

What is the Exchange-Correlation Potential, E_{xc} ?

Thermodynamics: ground state == lowest energy state

Pauli exclusion principle
→ Exchange energy.

Repulsion of opposite spins
→ Correlation energy.

DFT lectures, 08/08+08/09/2009, UNM

6

Exchange Correlation Functionals

Active research field to develop better E_{xc} functionals:

- LDA : $E_{xc} = E_{xc}(\rho)$
Ceperley and Alder (1981)...

- GGA : $E_{xc} = E_{xc}(\rho, \nabla \rho)$
PW91 (1991), PBE (1996),
revPBE (1996), rPBE (1999)...

DFT lectures, 08/08+08/09/2009, UNM

7

Exchange Correlation Functionals: Which one to choose?

Depends on system and variable of interest:

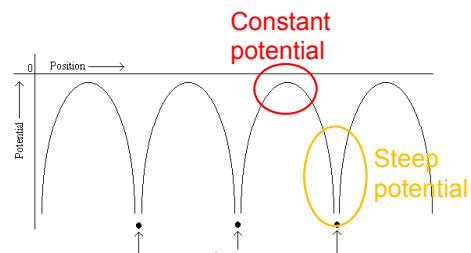

Iron: LDA gives *incorrect* ground state (hcp rather than bcc); GGA correct ground state.

SiO₂: LDA gives better agreement with experiment at high pressures than GGA.

DFT lectures, 08/08+08/09/2009, UNM

8

Suitable Electronic Wave Functions

Solutions to Schrödinger equation with **constant potential**:

Planewaves: $\psi \sim \exp(i k r)$

Works best for "flat" potentials.

<http://gauss.sdsmt.edu/~bhemmelm/quantu1.gif>

DFT lectures, 08/08+08/09/2009, UNM

9

Brillouin zones

Crystal: Periodic Structure in 3-d space

Planewaves: $\psi \sim \exp(i k r)$

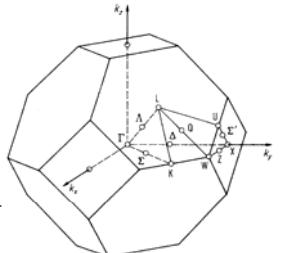

→ Fourier transform.

1st Brillouin zone: range of independent values.

Definition:

$$\vec{k}_i = \frac{n_i}{N_i} \vec{b}_i; \quad \vec{b}_1 = 2\pi \frac{\vec{a}_2 \times \vec{a}_3}{V_{cell}}$$

1,2,3 cyclic

Face-centered cubic

Same as in xrd.

DFT lectures, 08/08+08/09/2009, UNM

10

Energy Cutoff

Planewaves: $\psi \sim \exp(i k r)$

Energy:

$$E(\vec{k}) = \frac{\hbar^2}{2 \cdot m_e} \vec{k}^2$$

Define cutoff energy: E_{\max}

$$E_{\max} = \frac{\hbar^2}{2 \cdot m_e} \vec{k}_{\max}^2$$

Note:

$$k = \frac{2\pi}{\lambda} \Rightarrow E_{\max} \uparrow \rightarrow k_{\max} \uparrow \rightarrow \lambda_{\min} \downarrow$$

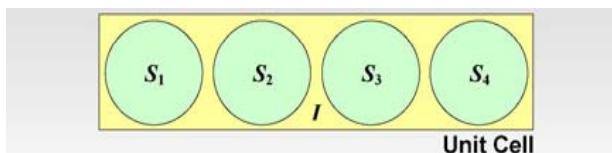

Increase E_{\max} to resolve finer details of the charge density.

DFT lectures, 08/08+08/09/2009, UNM

11

Pseudopotentials

"Problem": Steep potential close to nuclei
→ plane waves are not well suited.

Idea: Most material/chemical properties rely on valence electrons.

Eliminate core electrons

Pseudopotential.

DFT lectures, 08/08+08/09/2009, UNM

12

Generation of Pseudopotentials

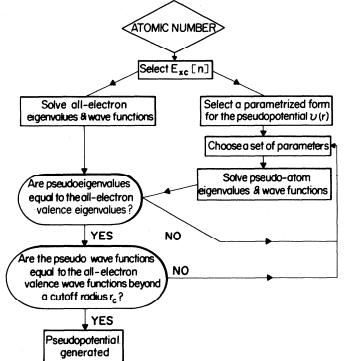

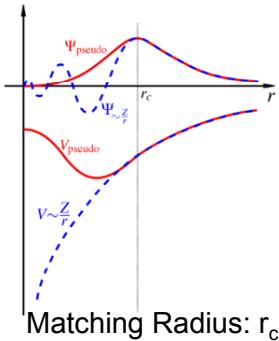

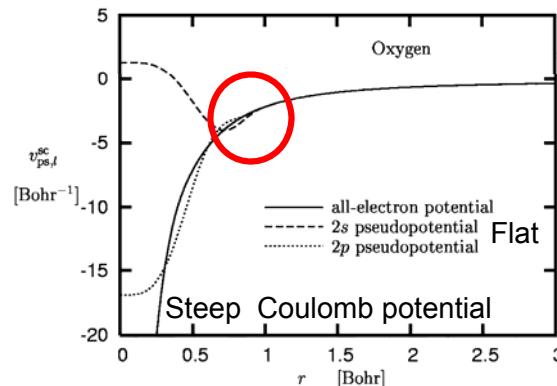

FIG. 6. Flow chart describing the construction of an ionic pseudopotential for an atom.

<http://upload.wikimedia.org/wikipedia/en/thumb/7/7e/SketchPseudopotentials.png/600px-SketchPseudopotentials.png>

13

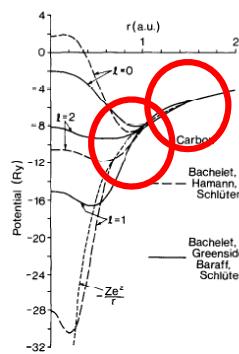

Oxygen: an example

DFT lectures, 08/08+08/09/2009, UNM

14

Carbon

Smaller r_c :
 → Better transferability.
 → higher energy cutoff.

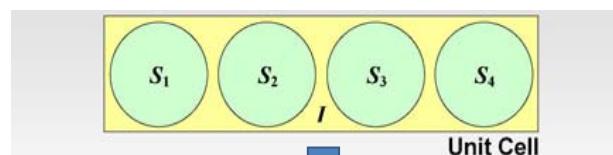

Pickett, 1999

DFT lectures, 08/08+08/09/2009, UNM

15

Alternative

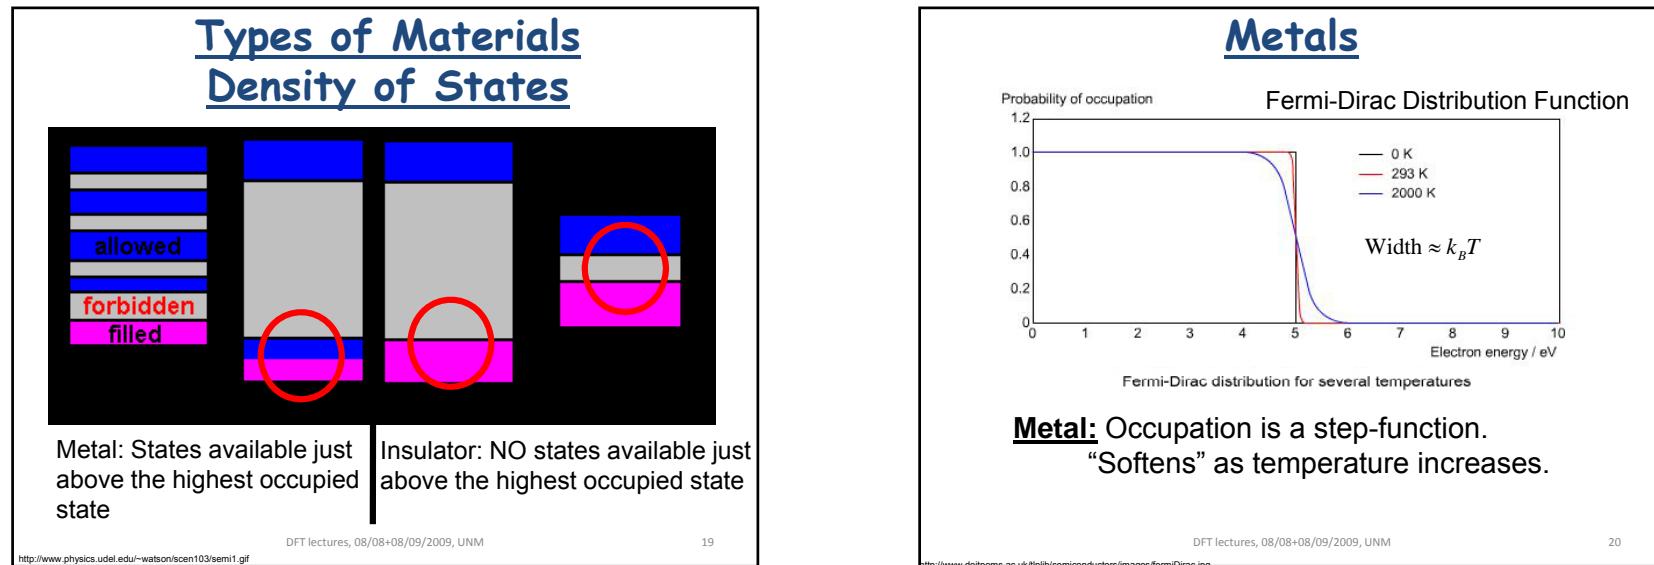

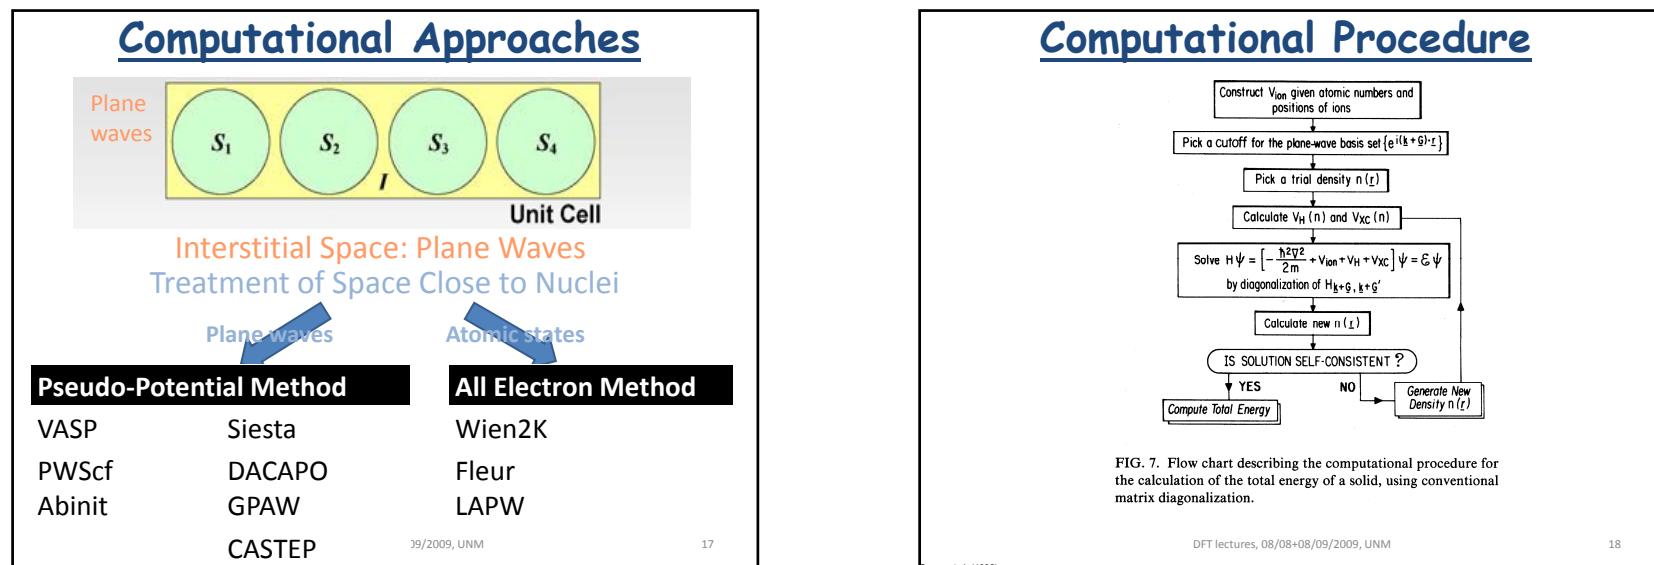

Separate space in different regions:
 Interstitial regions → plane waves as before.
 Regions around the nucleus:
 use atomic-like states.

All-electron methods.
(structural optimization difficult to implement, i.e. WIEN2k)

DFT lectures, 08/08+08/09/2009, UNM

16

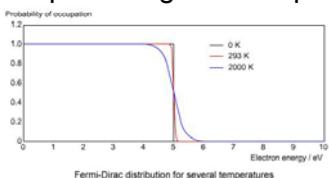

Metals: Consequences - I

Problem:

At T=0 K (low temperatures)

Rapid change of occupation from 1 to zero.

During optimization: unoccupied wave functions become occupied and vice versa
→ Oscillations and instabilities.

DFT lectures, 08/08+08/09/2009, UNM

21

Metals: Consequences-II

Need to know charge density (wave functions) in the (1st) Brillouin zone very well

→ Expectation that we need a dense k-point mesh.

DFT lectures, 08/08+08/09/2009, UNM

22

Convergence Test

Carefully check variation of
 $E=E(E_{\max}, \text{k-point mesh})$

Two steps:

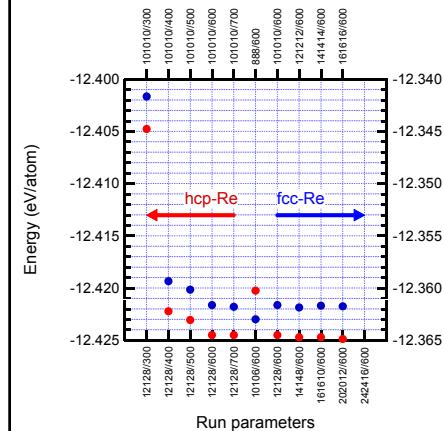

- 1) Fix E_{\max} and increase k-point mesh size.
- 2) Fix k-point mesh size and vary E_{\max} .

Changes between subsequent calculations
should be less than 1 meV/atom.
(criterion may vary for specific applications)

DFT lectures, 08/08+08/09/2009, UNM

23

Convergence Test: Rhenium

DFT lectures, 08/08+08/09/2009, UNM

24

Rhenium (Re):

- Convergence:
hcp-Re: 600 eV;
12x12x8.
- fcc-Re: 600 eV;
10x10x10.
- $E(\text{hcp}) < E(\text{fcc})$
- hcp-Re more stable, as observed experimentally.
(Not shown: Pt: 600 eV; 14x14x14).

Insulators

Occupied and unoccupied states are separated by an energy gap of finite width.

→ We do not expect instabilities and oscillations due to changing occupation numbers.

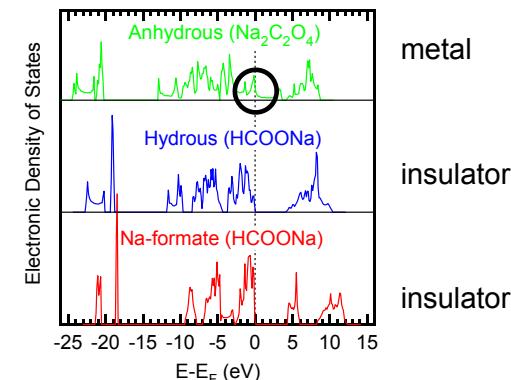

→ Less dense k-point meshes than for metals.

Even though not shown here experience shows that this expectation is supported.

DFT lectures, 08/08+08/09/2009, UNM

25

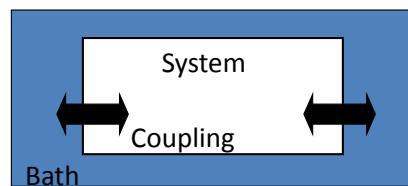

Example: Computed Density of States

DFT lectures, 08/08+08/09/2009, UNM

26

Temperature: Extended System Approach (Anderson, 1980)

Idea: 0th law of thermodynamics: Bring system in contact with heat bath.

Thermostat: $\langle T \rangle = \text{constant}$.

→ Choose coupling such that the proper ensemble is modeled (Nose, 1984a, 1984b).

But other options exist: Lattice-dynamics.

DFT lectures, 08/08+08/09/2009, UNM

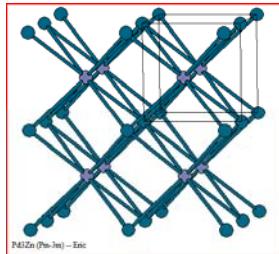

27

Lattice Dynamics

DFT lectures, 08/08+08/09/2009, UNM

28

Bulk-Structures-I

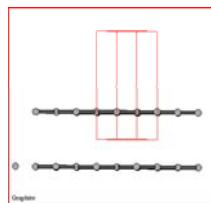

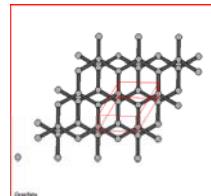

Hypothetical:
Cubic-Pd₈Zn₈
Cubic-Pd₅₀Zn₅₀

- Bulk-calculations:
 - Periodic → good match with plane waves.
 - Solid solutions (alloying): Vary composition.
 $Pd_8Zn_8 \rightarrow Pd_9Zn_7$
 - Disorder: fixed composition. Exchange Pd \leftrightarrow Zn.

DFT lectures, 08/08+08/09/2009, UNM

29

Bulk-Structures-II

Graphite:

- sp^2 – hybridization.
- intra-plane sigma bonds.
- inter-plane van der Waals.

 Origin: fluctuating dipoles.

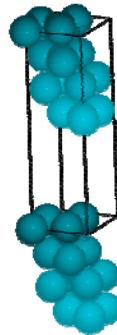

But:

- theory here: time independent → van der Waals compounds not necessarily well described. (New functionals).

DFT lectures, 08/08+08/09/2009, UNM

30

Surfaces-I

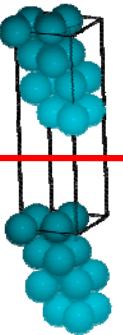

fcc-Pd(111)-slab.

- 2-d periodic.
- Symmetry broken in 3rd dimension.
- Vacuum layer (10-20 Å).
- No electrons in vacuum.
- But: we use planewaves...
→ Need higher energy cutoff to make charge density zero in vacuum.
- Alternative: do not use planewaves.
- But more localized functions: wavelets, finite-elements...

DFT lectures, 08/08+08/09/2009, UNM

31

fcc-Pd(111)-slab.

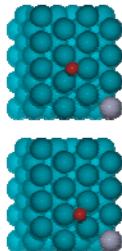

Surfaces-II

- slab thick enough such that surface relaxation can be accounted for.
- 4 layers sufficient, relax top two layers (test convergence).
- asymmetric slab: Artificial induced (electrical) dipole moment. Long ranged
→ two options:
 - make vacuum thick enough, 15 – 20 Å.
 - Compensate by additional dipole. (VASP: middle of the cell).

DFT lectures, 08/08+08/09/2009, UNM

32

Surfaces-III

fcc-Pd(111)-slab.
(top-view)

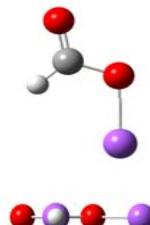

- adsorption.
Example: CO, MeOH, EtOH, ...
→ Many molecules are polar
($\Delta EN \neq 0$)

- Same problem as with the asymmetric slab, same options to solve the problem.

DFT lectures, 08/08+08/09/2009, UNM

33

Molecules

- Electrons are localized.
• Same difficulty as for surfaces.

Note: Adsorption energies are energy differences
→ At least partial compensation.

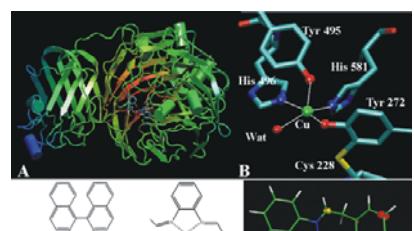

Alternatives to plane waves are:
Wavelets and finite elements.

DFT lectures, 08/08+08/09/2009, UNM

34

Quantum Mechanics + Molecular Mechanics/dynamics

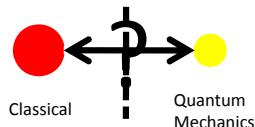

Hybrid methods: QM//MM/MD
• “Local” → quantum mechanics.
• “Non-local” → classical mechanics/molecular dynamics.

<http://bio.phys.unimail.it/goose.gif>

Advantage:
• Focus on active portion.
• Large scale: details are “less” important.

Disadvantage:
• Boundary: QM + MM?
• “Cutting” through bonds.

35

Some Applications of DFT

Earth's and Planetary Sciences:

- Electrons in planetary interiors.
- Melts at high pressure.

Environmental Geosciences:

- Structure of $(\text{H}_3\text{O})^+\text{Fe}(\text{SO}_4)_2$

Student presentations

- Andrew: $\text{Pt}_{1-x}\text{Re}_x$ solid solutions.
- Eric: Pd on gamma- Al_2O_3 .
- Levi: Pd on alpha- Al_2O_3 .
- Sam: non-Pt based catalysts.

DFT lectures, 08/08+08/09/2009, UNM

36

Planetary Interiors

(Stixrude et al., 1998)

Plasma model

$$P = 0.176 r_s^5 \cdot [1 - (0.407 \cdot Z^{2/3} + 0.207) \cdot r_s]$$

$$r_s = \left(\frac{3}{4\pi\rho} \right)^{1/3}$$

Gellman and Brueckner (1949)
Hubbard (1984)

Explanation:

- Coulomb attraction important.
- Electrons are not a plasma.
- Predicted density is too HIGH.
- Electronic screening.

Observations:
Charge density too high.

DFT lectures, 08/08+08/09/2009, UNM 37

Melts at High Pressure

(Mookherjee et al., 2008)

1 GPa $\sim 10^4$ atm

Background:

- Constitution of the Earth's interior.
- Abundance and distribution of hydrogen.
- Hydrogen affects: density, viscosity, elasticity, electrical conductivity, ...

$12 * \text{MgSiO}_3 + 8 * \text{H}_2\text{O} = 84 \text{ atoms. } 0 - 120 \text{ GPa, } 3000 - 6000 \text{ K.}$

a T=3000 K
Low pressure: OH, H2O, Mg-OH2.
b T=3000 K
High pressure: also Si-O-H2O-O-Si
Pressure dependent H2O speciation:

DFT lectures, 08/08+08/09/2009, UNM 38

Implications

• Neutrally buoyant?
Hydrous melt lenses.
Seismic observations (Song et al., 2004).

• Conduction dominated by hydrogen diffusion.

• P=14 GPa, T=1800 K:
 $\sigma \sim 18 \text{ S/m.}$

• Conduction should be high enough to be detectable, through electromagnetic sounding.

Figure 3 | Self-diffusion coefficient of hydrogen. Results at 3,000 K (blue), 4,000 K (green) and 6,000 K (red) from our simulations (symbols) and an Arrhenius fit to the simulation results (lines) (equation (1) with $D_0 = 9.2 \times 10^{-7} \text{ m}^2 \text{ s}^{-1}$, $E^* = 86 \text{ kJ mol}^{-1}$ and $V^* = 0.11 \text{ cm}^3 \text{ mol}^{-1}$). The value of the activation energy is similar to that found in hydrostatic melt diffusion experiments ($82 \pm 32 \text{ kJ mol}^{-1}$) and the diffusion coefficient extrapolated to 3,000 K from lower temperature, low-pressure experiments ($2.4 \times 10^{-7} \text{ m}^2 \text{ s}^{-1}$), indicating that proton diffusion does not depend strongly on melt composition. Error bars represent one-s.d. uncertainties.

DFT lectures, 08/08+08/09/2009, UNM 39

Environment Geochemistry

Berkeley Pit; Butte, Montana
Mining operation: 1955 - .
Copper, silver, gold.

2007: 1249 Superfund-sites in the USA
Toxic metals and formation of SO_4^{2-} .

Objectives:

- Restoration of mining areas.
- Environmental hazards.
- Superfund sites.
- Water management.
- Ecology.

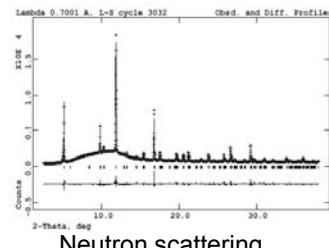

DFT lectures, 08/08+08/09/2009, UNM 40

Crystallography of Complex Structured Sulfate Minerals - $(\text{H}_3\text{O})^+\text{Fe}(\text{SO}_4)_2$

(Majzlan and Kiefer, in prep.)

Objective:

Crystal Structure =
Theory + Neutrons + X-rays?

Neutron scattering

DFT lectures, 08/08+08/09/2009, UNM

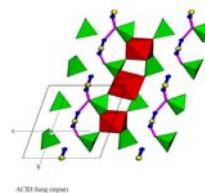

Problem:

- Hydrogen positions cannot be determined reliably → structure only partially solved.

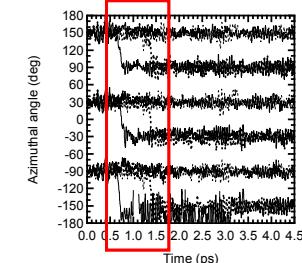

Idea: Heavy cations from experiment and hydrogen positions from theory.

41

Ab-Initio Structure Refinement

Initial Structure:
Heavy ions neutron scattering; H planar group

After ~1-1.5 ps rotations of half the H₃O⁺ ions.

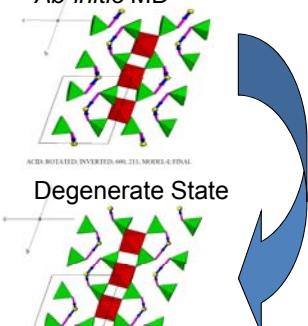

DFT lectures, 08/08+08/09/2009, UNM

Majzlan and Kiefer (in prep.)

42

Structure Evaluation

Final structure:
Ab-initio MD

$$\Delta E \approx 0.07 \text{ meV / atom}$$

Activation energy:
~4.1 meV/atom
(300 K == 25 meV)

- Groundstate of $(\text{H}_3\text{O})^+\text{Fe}(\text{SO}_4)_2$: superposition of two states.
- Dynamical Disorder.
- May explain difficulty of hydrogen refinements.

DFT lectures, 08/08+08/09/2009, UNM

43

Summary

- Classical Potentials: Pro's and Con's.
- Density-Functional-Theory (DFT):
 - Universal, E_{XC} .
 - Pseudopotentials.
 - Planewaves.
 - Predictive power.
 - Complementary to experiment.
- Finite temperature *ab-initio* Molecular Dynamics.

Theory addresses different classes of problems:

- Determination of significant fact.
- Matching of facts with theory.
- Articulation of theory.

(Categorization after: T. Kuhn, 1962)

DFT lectures, 08/08+08/09/2009, UNM
